### 3 Proceedings

### 3.1 Inputs

The formulas have several inputs. While some are used as placeholders in definitions, others have actual meaning in the context of the application of the functions.

### Definition of Variables (by function):

 $\Xi(v; w; x; y; z)$ : All inputs to this function are placeholders.  $v, w, x, y, z \in \mathbb{R}$   $Rd_n(x)$ ;  $Ex_n(x)$ : All inputs to this function are placeholders.  $x \in [0; 100]$ ;  $n \in \mathbb{N}_0$   $\Theta(r)$ ;  $\beta(r)$ : r is a variable which controlls the sensitivety of the  $\Phi_e, \Phi_0$  and  $\Phi_n$  functions.  $r \in \mathbb{Z}$ 

 $\Phi_e(c;r); \quad \Phi_0(c;r); \quad \Phi_n(c;r): c$  is the main input variable of the  $\Phi_e, \Phi_0$  and  $\Phi_n$  functions. It can be thought of as ,,purity" or other qualities. (see Examples section for more details.) $c \in [0;1]$  (for  $\Phi_e \quad c \in [\Theta(r);1]$ ); r is a variable which controlls the sensitivety of the  $\Phi_e, \Phi_0$  and  $\Phi_n$  functions.  $r \in \mathbb{Z}$ 

 $\Lambda_0(s;r)$ ;  $\Lambda_n(s;r)$ : s is the score calculated from c using  $\Phi_0$  or  $\Phi_n$ .  $s \in ]-\infty;100]$ ; r is a variable which controlls the sensitivety of the  $\Lambda_0$  and  $\Lambda_n$  functions.  $r \in \mathbb{Z}$ 

 $\delta(x)$ ;  $\delta_s(x)$ : All inputs to this function are placeholders.  $x \in [0;1]$ 

 $\chi(x)$ : All inputs to this function are placeholders.  $x \in [0, \infty[$ 

#### 3.2 Formulas

$$\Xi(v; w; x; y; z) = \begin{cases} v & \text{for } y > z \\ w & \text{for } y = z \\ x & \text{for } y < z \end{cases}$$
 (1)

$$Rd_n(x) = x \cdot 10^n + 100 \cdot (1 + 10^n) \tag{2}$$

$$Ex_n(x) = Rd_{-n}(x) \tag{3}$$

$$\Theta(r) = (1 + 10^{-r})^{-9} \tag{4}$$

$$\beta(r) = 9 \cdot \log_{10}(1 + 10^{-r}) \tag{5}$$

$$\Phi_e(c; r) = 100 \cdot \sqrt{1 + \frac{\log_{10}(c)}{\beta(r)}}$$
(6)

$$\Phi_0(c;r) = \Xi(\Phi_e(c;r); \Phi_e(c;r); 0; c; \Theta(r))$$
(7)

$$\Phi_n(c;r) = Rd_n(\Phi_0(c;r)) \tag{8}$$

$$\Lambda_0(s;r) = 10^{\beta(r) \cdot \left(\left(\frac{s}{100}\right)^2 - 1\right)} \tag{9}$$

$$\Lambda_n(s;r) = \Lambda_0(Ex_n(s);r) \tag{10}$$

$$\delta(x) = -\log_{10}(1 - x) \tag{11}$$

$$\delta_s(x) = -|\log_{10}(1-x)| \tag{12}$$

$$\chi(x) = \sum_{k=1}^{x} \left(\frac{9}{10^k}\right) = 1 - 10^{-x} \tag{13}$$

- 3.3 Explonation
- 3.4 Outputs
- 3.5 Interpretation of outputs

#### 3.6 Examples

There are several possible areas of application for the goldsmith functions. Some of these applications include the purity of precious metalls, reliability, accuracy of AI algorithems, data fidelity, purity of silicon in the semiconductor industry and many more. Below there are some example values.

```
99.999998% gold = 88.19r8 - 0 \ gold

99.9999999954% silicon = 69.92r12 - 0 \ silicon

10.0\% \ gold \ content \ in \ ore = 79.43r0 - 0 \ gold \ content \ in \ ore

58.3\% \ gold \ content \ in \ 14k \ gold = 60.91r1 - 0 \ gold \ content \ in \ 14k \ gold

93.0% forgor = 43.55r2 - 0 \ forgor

0.6\% \ copper \ content \ in \ ore = 42.42r0 - 0 \ copper \ content \ in \ ore

99.5% uptime = 66.54r4 - 0 \ uptime

100 \cdot c\% \ [quantity] = [\Phi_n(c;r)]r[r] - [n] \ [quantity]
```
